

TP3525 Series

REGULATING PWM IC

DESCRIPTION

The **TP3525** is a pulse width modulator IC and designed for switching power supplies application to improve performance and reduce external parts usage.

A shutdown terminal controls both the soft-start circuitry and the output stages, providing instantaneous turn off through the PWM latch with pulsed shutdown, as well as soft-start recycle with longer shutdown commands. The output stage features NOR logic, giving a LOW output for an OFF state. An under-voltage lockout circuitry, which keeps the outputs off and the soft-start capacitor discharged for sub-normal input voltages, includes approximately 500 mV of hysteresis for jitter free operation. The PWM circuits also feature a latch following the comparator. When a PWM pulses has been terminated, the outputs will remain off for the duration of the period. The latch is reset with each clock pulse. The output stages are totem-pole designs capable of sourcing or sinking in excess of 200mA.

FEATURES

- * Input Voltage: 8~35V
- * On-chip +5.1V reference is trimmed to $\pm 1\%$
- * 100HZ ~ 400KHZ oscillator range
- * Separate oscillator sync terminal
- * Adjustable dead time control
- * Internal soft-start
- * Pulse-by-pulse shutdown
- * Input under-voltage lockout with hysteresis
- * Latching PWM to prevent multiple pulses
- * Dual source/sink output drivers

BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	V_{IN}	40	V
Collector Supply Voltage	V_C	40	V
Oscillator Charging Current	I_{OSC}	5	mA
Output Current, Source or Sink	I_O	500	mA
Reference Output Current	I_R	50	mA
Current through C_T Terminal	I_T	5	mA
Logic Inputs		- 0.3 ~ + 5.5	V
Analog Inputs		-0.3 ~ V_i	V
Total Power Dissipation at $T_a=70^\circ\text{C}$	P_D	1000	mW
Junction Temperature	T_J	-55 ~ +125	$^\circ\text{C}$
Operating Ambient Temperature	T_{ORP}	0 ~ +70	$^\circ\text{C}$
Storage Temperature	T_{STG}	-65 ~ +150	$^\circ\text{C}$

Note: Absolute maximum ratings are those values beyond which the device could be permanently damaged.
Absolute maximum ratings are stress ratings only and functional device operation is not implied.

RECOMMENDED OPERATING CONDITIONS (NOTE)

PARAMETER	SYMBOL	RATINGS	UNIT
Input Voltage	V_{IN}	8 ~ 35	V
Collector Supply Voltage	V_C	4.5 ~ 35	V
Sink/Source Load Current (steady state)	I_{STEAD}	0 ~ 100	mA
Sink/Source Load Current (peak)	I_{PEAK}	0 ~ 400	mA
Reference Load Current	I_{LOAD}	0 ~ 20	mA
Oscillator Frequency Range	F_O	100 ~ 400K	Hz
Oscillator Timing Resistor	R_O	2 ~ 150	K Ω
Oscillator Timing Capacitor	C_O	0.001 ~ 0.1	μF
Dead Time Resistor Range	R_T	0 ~ 500	Ω

Note: Range over which the device is functional and parameter limits are guaranteed.

THERMAL DATA

PARAMETER		SYMBOL	RATING	UNIT
Thermal Resistance Junction-ambient	DIP16	θ_{JA}	80	$^\circ\text{C/W}$
	SOP-16	θ_{JA}	50	$^\circ\text{C/W}$
	SOP-16W			
	TSSOP-16			

Note: Thermal resistance junction-alumina with the device soldered on the middle of an alumina supporting substrate measuring 15×20 mm; 0.65 mm thickness with infinite heat sink.

ELECTRICAL CHARACTERISTICS ($V_{IN} = 25V$, unless otherwise specified)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
REFERENCE SECTION						
Output Voltage	V_{REF}	$T_J = 25^\circ C$	5	5.1	5.2	V
Total Output Variation (Note 1)		Line, Load and Temperature	4.95		5.25	V
Long Term Stability (Note 1)	ΔV_{REF}	$T_J = 125^\circ C$, 1000 hrs		20	50	mV
Line Regulation	ΔV_{REF}	$V_{IN} = 8 \sim 35 V$		10	20	mV

Fall Time (Note 1)	t _F	C _L = 1 nF, T _J = 25°C		50	300	ns
TOTAL STANDBY CURRENT						
Supply Current	I _S	V _{IN} = 35 V		14	20	mA

Notes: 1. The parameters are not 100% tested in production.

2. Tested at fosc=40 KHz (R_T=3.6 KΩ, C_T=10nF, R_D=0 Ω). Approximate oscillator frequency is defined by :

$$f = \frac{1}{C_T(0.7R_T + 3R_D)}$$

3. DC transconductance (g_M) relates to DC open-loop voltage gain (G_V) according to the following equation:
G_V=g_MR_L where R_L is the resistance from pin 9 to ground. The minimum g_M specification is used to calculate minimum G_V when the error amplifier output is loaded.

TEST CIRCUIT

APPLICATION INFORMATION AND CIRCUIT

SHUTDOWN OPTIONS (see Block Diagram)

Since both the compensation and soft-start terminals (Pins 9 and 8) have current source pull-ups, either can readily accept a pull-down signal which only has to sink a maximum of $100\mu\text{A}$ to turn off the outputs. This is subject to the added requirement of discharging whatever external capacitance may be attached to these pins.

An alternate approach is the use of the shutdown circuitry of Pin 10 which has been improved to enhance the available shutdown options. Activating this circuit by applying a positive signal on Pin 10 performs two functions: the PWM latch is immediately set providing the fastest turn-off signal to the outputs; and a $150\mu\text{A}$ current sink begins to discharge the external soft-start capacitor. If the shutdown command is short, the PWM signal is terminated without significant discharge of the soft-start capacitor, thus, allowing, for example, a convenient implementation of pulse-by-pulse current limiting. Holding Pin 10 high for a longer duration, however, will ultimately discharge this external capacitor, recycling slow turn-on upon release.

Pin 10 should not be left floating as noise pickup could conceivably interrupt normal operation.
